

Group Ordering Automation

Problem

Group ordering is slow and manual
→ One person collects orders, adds items, and splits bills
→ Takes 15–30 mins and is error-prone

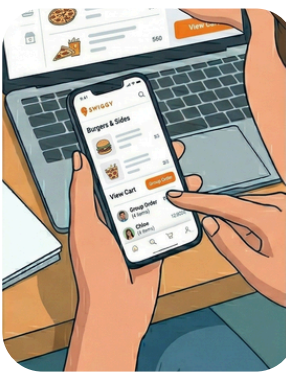

Solution –A shared live cart where everyone orders independently

→ Join via link → Add items → Auto-merged cart → Split payment

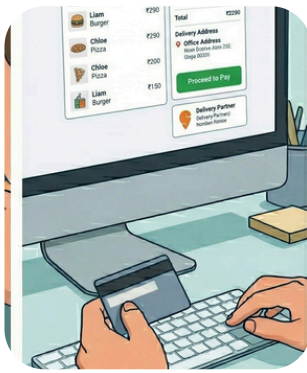

Current Flow (Manual & Fragmented)

Chat & Collect Orders

Add to cart

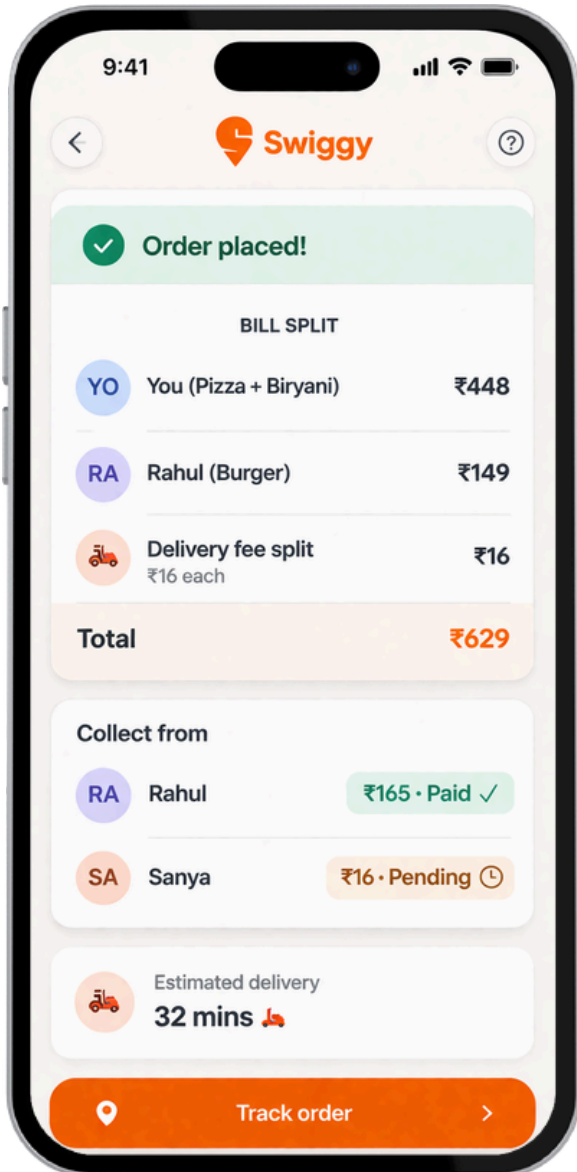

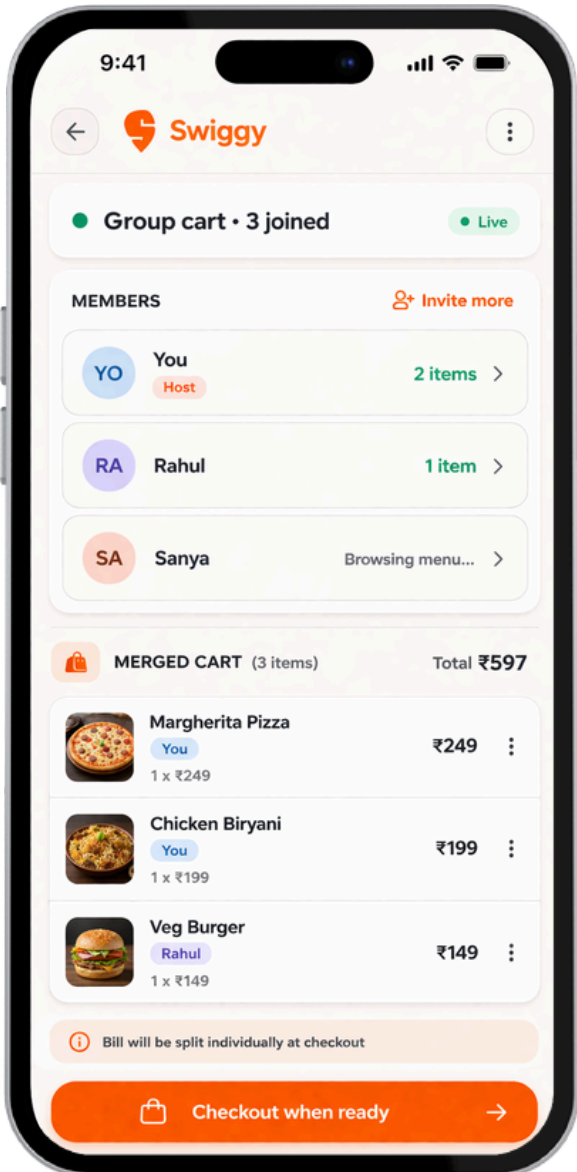

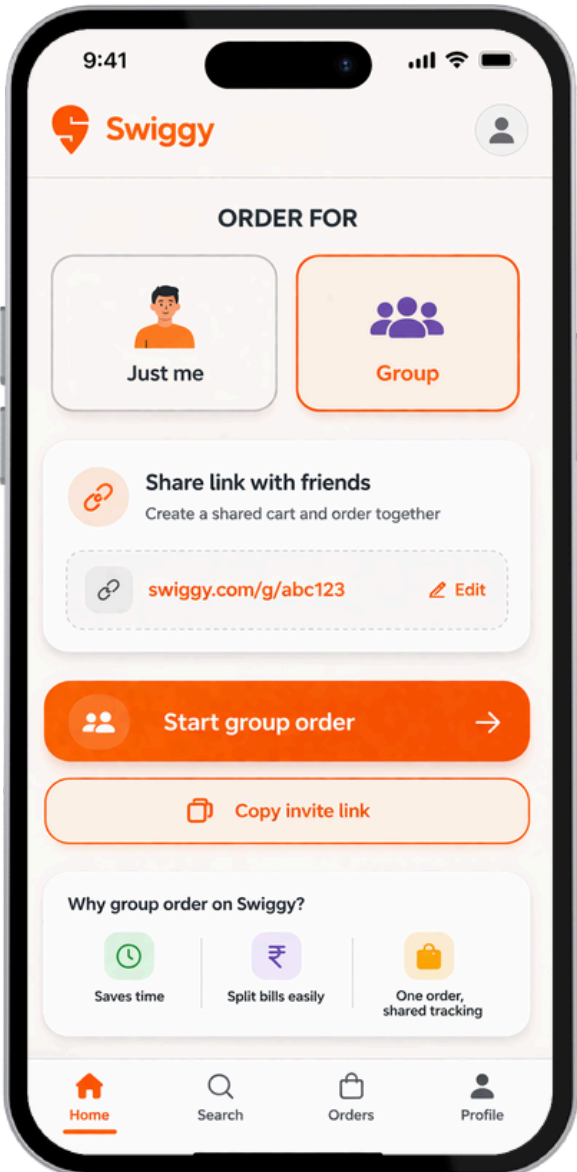

Place Order

Split Payments

Success Metrics (KPIs)

- Order completion time → Target: <5 mins (vs 15–30 mins)
- Conversion rate → Group sessions → checkout
- Drop-off rate → Invite → join → add items
- Average order value (AOV) → Group vs solo orders
- Repeat usage rate → % users reusing group feature
- Participation rate → Avg. members per group order

Key Trade-offs / Risks

- Reduced host control → No easy veto or budget enforcement
- Order inconsistency → Edits after partial payments
- Payment disputes → Failed/partial transactions
- Privacy concerns → Visible items/preferences
- System complexity → Real-time sync, edge-case failures
- Adoption friction → Users may stick to usual chat flow
